BEE Solution

Addressed Challenges

Forecasting external and internal parameter changes

Peak energy usage shifting to renewables

Proactive optimization of building control

Estimating building inertia, reactivity and occupancy

↓ 15%
Energy Consumption
Reduction

↓ 15%
Emissions Reduction

↑ 100%
User Comfort

Phase 1 Learned Lessons

- Abundant, yet unorganized data
- Multiple formats and languages
- Different services provide same data in different formats
- Crucial to organize and arrange data
- Buildings are very inefficient, yet so much data about them is available.
- High saving potentials reside within building data

Phase 2 Plans

- Utilize Platform of Trust to work with data.
- Train an AI algorithm to forecast building behaviour
- Simulate control parameters for Metropolia campus
- Test and provide a lab demonstration at Metropolia campus
- Plan a roadmap for further testing the prototype

Phase 2 Challenges

- Bring a prototype to a real lab environment.
- Balance between full-on testing and staying within lab boundaries.
- Combine multiple data sources into one data frame
- Asymmetric setups of rooms, floor areas, buildings.
- Design the solution in a scalable fashion
